Sample Design:
A Controller for a Simple Traffic Light

## Assumption: Two Linked Pairs of Traffic Lights

If one light is Green, the "cross light" must be Red.

## Assumed Cycling Rules

| One Light | Cross Light | Comments |
| :---: | :---: | :--- |
| Green | Red | Traffic moving on one street |
| Yellow | Red | Traffic on cross street must wait <br> for this light to turn red. |
| Red | Red | Both lights are red for about <br> one second. |
| Red | Green | Cross traffic now moves. |

This is the basic sequence for a traffic light without turn signals or features such as an "advanced green", etc.

## Name the States

| State | Light 1 | Light 2 | Alias |
| :---: | :---: | :---: | :---: |
| 0 | Red | Red | RR |
| 1 | Red | Green | RG |
| 2 | Red | Yellow | RY |
| 3 | Red | Red | RR |
| 4 | Green | Red | GR |
| 5 | Yellow | Red | YR |

## Step 1a: State Diagram for the System

Notation: $\mathrm{L}_{1} \mathrm{~L}_{2}$, so $\mathrm{RG} \Rightarrow$ Light 1 is Red and Light 2 is Green The six-state design is more easily implemented.

## Step 1b: Define the State Table

| Present State |  | Next State |  |
| :---: | :---: | :---: | :---: |
| Number | Alias | Number | Alias |
| 0 | RR | 1 | RG |
| 1 | RG | 2 | RY |
| 2 | RY | 3 | RR |
| 3 | RR | 4 | GR |
| 4 | GR | 5 | YR |
| 5 | YR | 0 | RR |

At the moment, this is just a modulo- 6 counter with unusual output.
We shall add some additional circuitry to allow for safety constraints.
The choice of Red - Red as state 0 is arbitrary, but convenient.

## Step 2: Count the States and Determine the Flip-Flop Count

There are six states, so we have $\mathrm{N}=6$.

Solve $2^{\mathrm{P}-1}<\mathrm{N} \leq 2^{\mathrm{P}}$ for P , the number of flip-flops.
$2^{\mathrm{P}-1}<6 \leq 2^{\mathrm{P}}$ gives $\mathrm{P}=3$, because $2^{2}<6 \leq 2^{3}$.

We denote the states by $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$, because the symbol " Y " is taken to indicate the color Yellow.

## Step 3: Assign a 3-bit Binary Number to Each State

This is a modified counter, so the assignments are quite obvious.

| State | $\mathbf{Q}_{\mathbf{2}}$ | $\mathbf{Q}_{\mathbf{1}}$ | $\mathbf{Q}_{\mathbf{0}}$ |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 1 |
| 2 | 0 | 1 | 0 |
| 3 | 0 | 1 | 1 |
| 4 | 1 | 0 | 0 |
| 5 | 1 | 0 | 1 |

We have two possible additional states: 6 and 7.
Normally, these are ignored, but we consider them due to safety constraints.

## Redefine the State Diagram to Add Safety

States 6 and 7 should never be entered. Each is "RR" for safety.

## Step 4a: Derive the Output Equations.

|  | Alias | $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | R 1 | G 1 | Y 1 | R 2 | G 2 | Y 2 |  |  |
| :--- | :---: | :---: | :---: | :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | RR | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |
| 1 | RG | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 0 |
| 2 | RY | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| 3 | RR | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |
| 4 | GR | 1 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 |
| 5 | YR | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 |
| 6 | RR | 1 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |
| 7 | RR | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |

Here are the output equations

$$
\begin{array}{ll}
\mathrm{G} 1=\mathrm{Q}_{2} \bullet \mathrm{Q}_{1}{ }^{\prime} \cdot \mathrm{Q}_{0}{ }^{\prime} & \mathrm{G} 2=\mathrm{Q}_{2}^{\prime} \cdot \mathrm{Q}_{1}{ }^{\prime} \cdot \mathrm{Q}_{0} \\
\mathrm{Y} 1=\mathrm{Q}_{2} \bullet \mathrm{Q}^{\prime} \cdot \mathrm{Q}_{0} & \mathrm{Y} 2=\mathrm{Q}_{2}^{\prime} \bullet \mathrm{Q}^{\prime} \bullet \mathrm{Q}_{0}{ }^{\prime} \\
\mathrm{R} 1=(\mathrm{G} 1+\mathrm{Y} 1)^{\prime} & \mathrm{R} 2=(\mathrm{G} 2+\mathrm{Y} 2)^{\prime}
\end{array}
$$

## Step 4a: Derive the Output Equations.

 (page 2)Here are the equations again.

$$
\begin{array}{ll}
\mathrm{G} 1=\mathrm{Q}_{2} \bullet \mathrm{Q}_{1}{ }^{\prime} \bullet \mathrm{Q}_{0}{ }^{\prime} & \mathrm{G} 2=\mathrm{Q}_{2}^{\prime} \bullet \mathrm{Q}_{1}{ }^{\prime} \bullet \mathrm{Q}_{0} \\
\mathrm{Y} 1=\mathrm{Q}_{2} \bullet \mathrm{Q}_{1} \cdot \bullet \mathrm{Q}_{0} & \mathrm{Y} 2=\mathrm{Q}_{2}^{\prime} \bullet \mathrm{Q}_{1} \bullet \mathrm{Q}_{0}^{\prime} \\
\mathrm{R} 1=(\mathrm{G} 1+\mathrm{Y} 1)^{\prime} & \mathrm{R} 2=(\mathrm{G} 2+\mathrm{Y} 2)^{\prime}
\end{array}
$$

We derive the Green and Yellow signals, which are easier.
We stipulate that if a light is not Green or Yellow, it must be Red.
Now add a safety constraint: If a light is Green or Yellow, the cross light must be Red.

$$
\begin{aligned}
& \mathrm{R} 1=(\mathrm{G} 1+\mathrm{Y} 1)^{\prime}+\mathrm{G} 2+\mathrm{Y} 2, \text { and } \\
& \mathrm{R} 2=(\mathrm{G} 2+\mathrm{Y} 2)^{\prime}+\mathrm{G} 1+\mathrm{Y} 1
\end{aligned}
$$

These equations may lead to a light showing two colors.
This is obviously an error situation.

Step 4b: Derive the State Transition Table.

| Present State |  | Next State |
| :---: | :---: | :---: |
|  | $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ |
| 0 | 000 | 001 |
| 1 | 001 | 010 |
| 2 | 010 | 011 |
| 3 | 011 | 100 |
| 4 | 100 | 101 |
| 5 | 101 | 000 |
| 6 | 110 | 000 |
| 7 | 111 | 000 |

## Step 5: Separate the Table into Three Tables

| $\mathrm{Q}_{2}$ |  | Q 1 |  | $\mathrm{Q}_{0}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PS | NS | PS | NS | PS | NS |
| $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | $\mathrm{Q}_{2}$ | $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | $\mathrm{Q}_{1}$ | $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | $\mathrm{Q}_{0}$ |
| 000 | 0 | 000 | 0 | 000 | 1 |
| 001 | 0 | 001 | 1 | 001 | 0 |
| 010 | 0 | 010 | 1 | 010 | 1 |
| 011 | 1 | 011 | 0 | 011 | 0 |
| 100 | 1 | 100 | 0 | 100 | 1 |
| 101 | 0 | 101 | 0 | 101 | 0 |
| 110 | 0 | 110 | 0 | 110 | 0 |
| 111 | 0 | 111 | 0 | 111 | 0 |

Color added to emphasize the transitions of interest.

## Step 6: Select the Flip-Flops to Use

Use JK flip-flops. What a surprise!

The excitation table for a JK flip-flop is given again.

| $\mathrm{Q}(\mathrm{T})$ | $\mathrm{Q}(\mathrm{T}+1)$ |  | J | K |
| :---: | :---: | :--- | :---: | :---: |
| 0 | 0 |  | 0 | d |
| 0 | 1 |  | 1 | d |
| 1 | 0 |  | d | 1 |
| 1 | 1 |  | d | 0 |

## Step 7: Derive the Input Tables

| Flip-Flop 2 |  |  |  | Flip-Flop 1 |  |  |  | Flip-Flop 0 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PS | NS |  | ut | PS | NS |  | put | PS | NS |  |  |
| $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | $\mathrm{Q}_{2}$ | $\mathrm{J}_{2}$ | $\mathrm{K}_{2}$ | $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | $\mathrm{Q}_{1}$ | $\mathrm{J}_{1}$ | $\mathrm{K}_{1}$ | $\mathrm{Q}_{2} \mathrm{Q}_{1} \mathrm{Q}_{0}$ | $\mathrm{Q}_{0}$ | $\mathrm{J}_{0}$ | $\mathrm{K}_{0}$ |
| 000 | 0 | 0 | d | 000 | 0 | 0 | d | 000 | 1 | 1 | d |
| 001 | 0 | 0 | d | 001 | 1 | 1 | d | 001 | 0 | d | 1 |
| 010 | 0 | 0 | d | 010 | 1 | d | 0 | 010 | 1 | 1 | d |
| 011 | 1 | 1 | d | 011 | 0 | d | 1 | 011 | 0 | d | 1 |
| 100 | 1 | d | 0 | 100 | 0 | 0 | d | 100 | 1 | 1 | d |
| 101 | 0 | d | 1 | 101 | 0 | 0 | d | 101 | 0 | d | 1 |
| 110 | 0 | d | 1 | 110 | 0 | d | 1 | 110 | 0 | 0 | d |
| 111 | 0 | d | 1 | 111 | 0 | d | 1 | 111 | 0 | d | 1 |

## Step 8: Derive the Input Equations

Here they are

$$
\begin{array}{lll}
\mathrm{J}_{2}=\mathrm{Q}_{1} \bullet \mathrm{Q}_{0} & \mathrm{~J}_{1}=\mathrm{Q}_{2}^{\prime} \bullet \mathrm{Q}_{0} & \mathrm{~J}_{0}=\mathrm{Q}_{2}^{\prime}+\mathrm{Q}_{1}^{\prime} \\
\mathrm{K}_{2}=\mathrm{Q}_{1}+\mathrm{Q}_{0} & \mathrm{~K}_{1}=\mathrm{Q}_{2}+\mathrm{Q}_{0} & \mathrm{~K}_{0}=1
\end{array}
$$

There is no need to summarize the equations.

## Step 10: Draw the Circuit
